

Telecom Clicker — Project Summary

How the game was made · The design documents · Where to find the plan

How This Game Was Made

- Started with a **basic plan made with GPT-5.6 Luna**: the concept, the era structure, and the core systems were sketched out.
- A **basic Python text game** was built first to test the plan — a playable proof of the loop (click → research → build → expand) before any real design work.
- Later, **DeepSeek-V4-Flash and GPT-5.6 Sol** were used to **balance the game and produce the concrete design**: the economy numbers, the tech tree, the pacing, the rival and news systems, and the final UI.
- The result is the concrete web game (`game/index.html`) plus a set of **markdown plan documents** that fully specify the game — all of them are in this repository on GitHub.

What Is in the Repository

Item	Description
<code>game/index.html</code>	Canonical web game — single file, mobile-first, EN/KO language packs, local save
<code>game/tech-nodes.json</code>	Tech tree data: 87 nodes, 4 branches × 6 eras, shared by all versions
<code>game/telecom_clicker.py</code>	Text edition of the game (Python 3, stdlib only, real-time, saves JSON)
<code>*.md</code> design docs	The plan files used to build the game (summarized below)
<code>PROMPT.md</code>	A general prompt that can recreate the whole game from scratch
<code>output/</code>	Release artifacts (Android <code>.aab</code> bundles)

The Plan Documents (Summaries)

gameplay-loop.md — Core Loop & Currencies

- Loop: Click (serve subscribers) → Build infrastructure → Research → Expand to new regions → Manage executives → Contracts → Finance (IPO/buybacks/dividends) → Prestige via network upgrades.
- Cash: from clicks, ARPU, interconnect, contracts — spent on build, R&D, buybacks. Clicks give cash only, never RP.
- RP: passive generation (CTO bonus, era events) — unlocks the tech tree.
- Other currencies: Spectrum Licenses (capacity cap, from auctions), Reputation (better IPO/bonds/contracts), Ownership % (>50% = safe from removal), Prestige Multiplier.
- Mobile: 8h offline earnings, portrait one-handed UI, notifications, ad boost (×2/30m), no-ads IAP, cloud save.

tech-tree.md — Technology Network

- 4 parallel branches (T=Transmission, S=Switching, A=Access, C=Core Network) × 6 eras, ≈161 nodes (28/era for eras 1–5, 21 in era 6).
- Eras: Analog Dawn (1880–1920), Electromechanical & Radio (1930–60), Digital & Satellite (1970–90), Broadband & IP (2000–15), Autonomous & SDN (2015–30), Interspace (2050+).
- Real technology throughout: Strowger, #5ESS, GSM, SS7, DWDM, 5G, quantum repeaters, neutrino transceivers, Dyson swarm.
- Prerequisites are often **cross-branch** (e.g. T10–S9, S11–C4) to model real-world dependencies; cross-branch weight grows with each era.
- Each era has 1–2 **Gateway Techs** that trigger a "Network Upgrade" prestige (permanent multiplier, unlocks next era).
- Pacing: RP starts at 5/s; era ceilings 8/12/18/27/40 RP/s; fastest legal route ≈7 simulated hours per era at cap; ≤30 min of capped RP carries across era transitions.

market-investment.md — Finance & Market

- Timeline: Founder → Revenue Bonds (E2) → VC → **optional IPO (E3)**: valuation = (revenue×3) + (subs×\$500) + spectrum × reputation; sell 20–40%.
- Shareholder control: >50% safe; <10% = CEO removed/company sold; hostile takeover at 15%+; defenses: buybacks, dividends, poison pill.
- Stock driven by quarterly reports (net adds, churn, CapEx/rev, Debt/EBITDA); random events incl. recession (–30%), activist investors.
- Spectrum auctions (e.g. AWS-3 ref \$81B), interconnect +5–15%.

infrastructure.md — Physical Network

- 5–7 asset types per era (copper trunk, switchboard, exchange → quantum repeater, lunar relay, interplanetary gateway).
- Region hierarchy: City → State → Country → Continent → Global → Lunar → Mars → Belt → Interstellar; inter-region transport must be deployed before serving.
- Penetration = subs/population (sigmoid); congestion (demand > capacity) penalizes revenue.
- Upgrades: levels 1–100 (exponential cost, linear capacity); automation RSO → NOC → AI → zero-touch; redundancy N+1 → 1:1 → ring diversity → geo-redundancy.

company-management.md — Organization

- CEO → C-suite (CFO/CTO/COO/CMO) → 9 departments → staff; the player manages aggregate metrics, never individual staff.
- Executives unlock by era, level 1–20 with +50/+100/+200/+400% bonus tiers; actions: Review/Order/Budget/Replace.
- Staffing: 3 slots/department, 5 levels (Junior→Director); actions: hire, training, poach, layoffs (–5% reputation).
- NOC (COO): uptime/MTTR only; 5 automation tiers from remote monitoring (T6) to zero-touch healing (C35, auto-fixes 60% of faults).

- Subscriber tiers (Residential \$20–80 → Government 99.999% SLA); churn formula = base × satisfaction/support/uptime/competition multipliers.
- Contracts: 7 types, \$5K–\$100M/month, SLA demands and penalties; CapEx split build/R&D/spectrum/DC.
- M&A: rural ISP \$5M–50M, spectrum \$100M–1B, studio \$50M–200M, merge \$1B+, tower REIT spin-off; partnerships (roaming, peering, MVNO).

rival-companies.md — Competition

- 2–4 generated rivals per playthrough: randomized name, home region >50% share, specialty, growth DNA (tech-first 1.5× RP/s, tech-follower copies tech), risk profile, era affinity.
- Market share formula: (your quality ÷ rival quality) × investment × capacity; ~30% quality edge needed in home regions; price war ×1.5, ads ×1.3.
- 8 rival events (outage, bankruptcy, merger, price war); intel unlocks via tech C4→C33.

news-system.md — Historical Events

- **140+ events** in two layers with priority: Layer 1 tech-triggered (fires on node completion, ~58 entries) + Layer 2 year-triggered (historical, 1880–2100, skips if tech already owned); then a random pool.
- 7 types: Regulation / Crisis / Breakthrough / Boom / Infrastructure / Competition / Future; persistent events last ±2 years; UI = ticker + searchable log.

revenue-effects.md & quality-competition.md — Quality & Revenue

- Quality model: 4 domains (Coverage, Speed, Reliability, Latency), each 0–100; tier weights vary by customer segment (Residential 30/30/20/20, Enterprise 5/25/50/20, Government 5/15/60/20 ...); overall quality = tier-weighted average × infra coverage.
- Every tech node and asset grants domain points (positive or negative); assets add recurring points.
- Revenue: $\text{regionRevenue} = \text{infraValue} \times \text{techMultiplier} \times \text{marketShare}$; $\text{techMultiplier} = 1 + \text{quality}/100$.
- Market share splits from the quality delta vs rivals; asset base revenue \$0.01 (copper) → \$5–12 (era 4) → \$20 (LEO) → \$5,000/s (Dyson swarm).
- Prestige on era transition: obsolete assets stop counting, ×1.5→×4.0 multiplier. Clicks: \$5 × tech × prestige multipliers.

rebirth+start.md — Rebirth

- Losing: hostile takeover (<10% ownership), shareholder revolt (<20% + 3 bad quarters), bankruptcy (debt > 2× annual revenue), or acquisition (<33% ownership).
- Rebirth: new company with **30% of previous value** (bankruptcy 15%; friendly acquisition 35%; forced 20%). Cash 30%; 30% of tech nodes randomly retained; lose spectrum/reputation/infra; keep one chosen executive.
- Permanent stacking bonuses: Veteran Founder (+1 exec slot per rebirth, cap +6), tech nodes cost 5% less RP per rebirth (cap 50%), contracts appear 2× faster early, legacy name recorded.

Change Logs from the Tuning Passes

- **UI Pass 2** — ad ON/OFF replaced by 0–100% slider (max 1% of daily gross); per-day income displays; rivals grouped by region; research ordered by node ID with T/S/A/C columns; next era dimmed; T7 depends on C1.
- **Economy Pass 3** — base click \$5 × tech × prestige; region-based infrastructure revenue formula; RP era caps 8/12/18/27/40 RP/s; fastest era ≈7h (≈6.5h after era 1); 30-min RP cap carryover.
- **Finance Pass 4** — click page shows only Revenue/ Quality; IPO renamed Finance with IPO + Bank subpages; revolving credit line (min \$500 or 6 months revenue); APR 3.00% (2.70–3.30%), rerolls every 3 game months; borrow 25/50/100%, repay 25%/max.
- **UI-REDESIGN.md** — the 2026 visual refresh (visual only, game logic intentionally unchanged).
- **ANDROID-UPDATE.md** — Android WebView shell notes (synchronized assets, build config, WebView hardening).

The .md plan files used to make this game are all on GitHub: github.com/kokoangho/tele-click-com — along with the working web game, the text edition, and PROMPT.md (a general prompt that can recreate the entire game from scratch).
