

Telecom Clicker — Project Summary

How the game was made · The design documents · Where to find the plan

How This Game Was Made

- Started with a **basic plan made with GPT-5.6 Luna**: the concept, the era structure, and the core systems were sketched out.
- A **basic Python text game** was built first to test the plan — a playable proof of the loop (click → research → build → expand) before any real design work.
- Later, **DeepSeek-V4-Flash and GPT-5.6 Sol** were used to **balance the game and produce the concrete design**: the economy numbers, the tech tree, the pacing, the rival and news systems, and the final UI.
- The result is the concrete web game (`game/index.html`) plus a set of **markdown plan documents** that fully specify the game — all of them are in this repository on GitHub.

What Is in the Repository

Item	Description
<code>game/index.html</code>	Canonical web game — single file, mobile-first, EN/KO language packs, local save
<code>game/tech-nodes.json</code>	Tech tree data: 87 nodes, 4 branches × 6 eras, shared by all versions
<code>game/telecom_clicker.py</code>	Text edition of the game (Python 3, stdlib only, real-time, saves JSON)
<code>*.md</code> design docs	The plan files used to build the game (summarized below)
<code>PROMPT.md</code>	A general prompt that can recreate the whole game from scratch
<code>output/</code>	Release artifacts (Android <code>.aab</code> bundles)

The Plan Documents (Summaries)

gameplay-loop.md

- Defines the core clicker loop: click → cash → research → infrastructure → revenue → more research.
- Lists currencies (cash, RP, users, quality) and how they flow; mobile-first design principles.
- Includes a summary matrix of all systems and how they connect.

tech-tree.md

- Full tech tree: 4 branches (Transmission / Switching / Access / Core) × 6 eras, ~161 nodes.
- Every node has prerequisites (cross-branch allowed), RP cost, era, quality effects (coverage/speed/reliability/latency).
- Canonical data lives in `game/tech-nodes.json` (87 era-0–4 nodes used by the game).

market-investment.md

- Financial layers: IPO, bonds, spectrum auctions, quarterly reports, M&A.
- Stock mechanics, share dilution, buybacks, and market events.

infrastructure.md

- 40+ asset types by era (copper trunk → quantum repeater), each with capacity and income.
- Region/grid hierarchy (city → state → country → ... → interstellar), penetration sigmoid, congestion penalties.
- Upgrades: levels 1–100, automation tiers (RSO → NOC → AI → zero-touch), redundancy (N+1 → geo-redundancy).

company-management.md

- 9 departments, C-suite executives, staffing, NOC operations.
- Customer tiers, M&A, regulatory events.

rival-companies.md

- Regional competitors with growth DNAs (tech-first, financial-first, balanced, tech-follower, aggressive, conservative).
- Market share mechanics, rival events, pressure on the player's footholds.

news-system.md

- 140+ historical events in two layers: tech-triggered (Layer 1) and year-triggered (Layer 2), plus a random pool.

revenue-effects.md

- Quick reference: which techs/infrastructure boost which quality domains, and how quality drives revenue.

quality-competition.md

- Quality model: 4 domains (coverage, speed, reliability, latency), competitor quality, revenue formula.
- Per-node quality values feed the score that multiplies income.

rebirth+start.md

- Getting kicked out (shareholders), hostile takeover, rebirth with 30% carryover and stacking bonuses.

Change logs from the tuning passes

- `CHANGES-UI-PASS-2.md` — UI redesign pass: layout, hierarchy, visual refresh.
- `CHANGES-ECONOMY-PASS-3.md` — economy balancing pass: costs, RP pacing, income curves.

- `CHANGES-FINANCE-PASS-4.md` — finance systems pass: bank, IPO, credit tuning.
- `UI-REDESIGN.md` — the 2026 visual refresh (visual only, logic unchanged).
- `ANDROID-UPDATE.md` — Android WebView shell notes (synchronized assets, build config).

The .md plan files used to make this game are all on GitHub: github.com/kokoangho/tele-click-com — along with the working web game, the text edition, and `PROMPT.md` (a general prompt that can recreate the entire game from scratch).
